

A combination of youth and experience - delivering excellence

Conventional Radiology is still the cornerstone of medical imaging and it constitutes the major bulk of investigations in imaging departments. The image of EKO was also built by its excellence in top quality X-Ray imaging. Recent introduction of **Digital X-Ray** has improved the image quality to a great extent and added the much needed flexibility in acquisition and processing of images. The radiation exposure is reduced by 20% approximately.

Apart from all routine procedures, some of the specialized investigations performed in the department are:

- IVU/MCU
- Sialography
- Fistulography
- Mammography
- Barium Studies
- Venography
- Orthopantomogram (OPG)
- Full leg, full spine imaging
